RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 28 pages. Original publisher: Golden, Colo. : National Renewable Energy Laboratory, 2008 OCLC Number: (OCoLC)316339870 Subject: Photovoltaic cells -- Research. Excerpt: . . . B5. Crack Elongation In Figure B8, we show a variation of the RUV f-scan of the resonance vibration peak at 41.4 kHz (non-cracked wafer) caused by the 16-mm crack located on the wafers corner and the same wafer with the crack elongated up to 34 mm. The data are presented for 125 mm x 125 mm Cz-Si wafer (27a) with 220-micron thickness. This is the very first experimental justification on a gradual variation of the RUV peak parameters with crack length performed on the same Si wafer. For this study, we used a specially designed experimental apparatus that allowed the wafer with initial seed crack to be bent with constant computer-controlled bending speed and bending amplitude. The wafer was positioned in a clamping device with a single corner exposed. The device was clamped along a 45-degree angle relating to a crystallographic 110 direction. The alignment was achieved using a previously cleaved Cz-Si dummy wafer. With the wafer clamped in the machine along its edge, a stepper-motor-controlled rod exerted downward pressure at the exposed corner of the wafer. Slow stepping speeds of about 40 microns per second were used with maximum amplitude of the wafers exposed corner deflection varied from 1 to 3 mm. In Figure B9, we present SAM images of the wafer part subjected to initial crack (a) and elongated crack (b). The effect of a crack elongation is quite substantial. It can be specified as a gradual downward peak shift, increase of the peak and width, and a strong reduction of the peak...
