EQUATIONS & ANSWERS

What is the value of x if $x + y = 25$ and $4x + y = 23$, what is the value of x ?

Correct answer: 2

Explanation: You can subtract the second equation from the first equation to eliminate y :

$$7x + y = 25 - 4x + y = 23; 7x - 4x = x; y = 9; 25 - 23 = 2$$

$$x = 2$$

You could also solve one equation for y and substitute that value in for y in the other equation:

$$4x + y = 23 - y + y = 23 - 4x$$

$$7x + y = 25 - 7x + (23 - 4x) = 23 - 4x + 23 - 4x = 2$$

What is the value of the x -coordinate of the point of intersection that is common to ALL three lines?

Correct answer: There is no point of intersection.

Explanation: If the point of intersection lies on all three lines, then we should be able to select any two lines, find their point of intersection, and make up with the same point of intersection each time. In other words, the point of intersection of the first two lines must be the point of intersection of the second and third lines.

Let's consider the first and second lines. We can solve the system of equations by substituting the value of y from the second equation into the first:

$$y = 2x + 3$$

$$x + 2(2x + 3) = 1$$

$$x + 4x + 6 = 1$$

$$5x = -5$$

$$x = -1$$

$$y = 2(-1) + 3 = 1$$

The point of intersection of the first two lines is $(-1, 1)$.

Now we can find the point of intersection of the second and third lines. Again, we can substitute the value of y from the second equation into the third:

$$y = 2x + 3$$

$$4x - 1(2x + 3) = 2$$

$$4x - 4x - 3 = 2$$

$$-3 = 2$$

$$x = -1.5$$

$$y = 2(-1.5) + 3 = 0$$

Thus, the second and third lines intersect at $(-1.5, 0)$.

Because the point of intersection between the first and second line does not coincide with the point of intersection between the second and third, there is no point that is common to ALL three lines. Thus, there is no point of intersection.

If $3x + 7z = 96$ and $z = 12$, what does x equal?

Correct answer: -6

Explanation: Subtract $7z$ from the both sides to get $-6x = -60$.

Divide both sides by -6 to get

What is the value of x ?

$$3x + 2y = 23$$

$$2x - 3y = 10$$

Correct answer: 6.30

Explanation: Solving for y in the first equation yields $y = 10.5 - 1.5x$. Plugging that into the second equation and solving for x yields 6.30.

$7x + 3y = 20$ and $-4x - 6y = 11$. Find the value of $3x - 3y$.

Correct answer: 31

Explanation: We can add these equations to one another:

$$(7x + 3y = 20) + (-4x - 6y = 11) = (3x - 3y = 31)$$

Consider the three lines given by the following equations:

$$x + 2y = 1$$

$$y = 2x + 3$$

$$4x - 3y = 2$$

Correct answer: 12

Explanation: Method 1: Add the two equations
